### THE EFFECT OF INTENSIVE TREATMENT OF DIABETES ON THE DEVELOPMENT AND PROGRESSION OF LONG-TERM COMPLICATIONS IN INSULIN-DEPENDENT DIABETES MELLITUS

THE DIABETES CONTROL AND COMPLICATIONS TRIAL RESEARCH GROUP\*

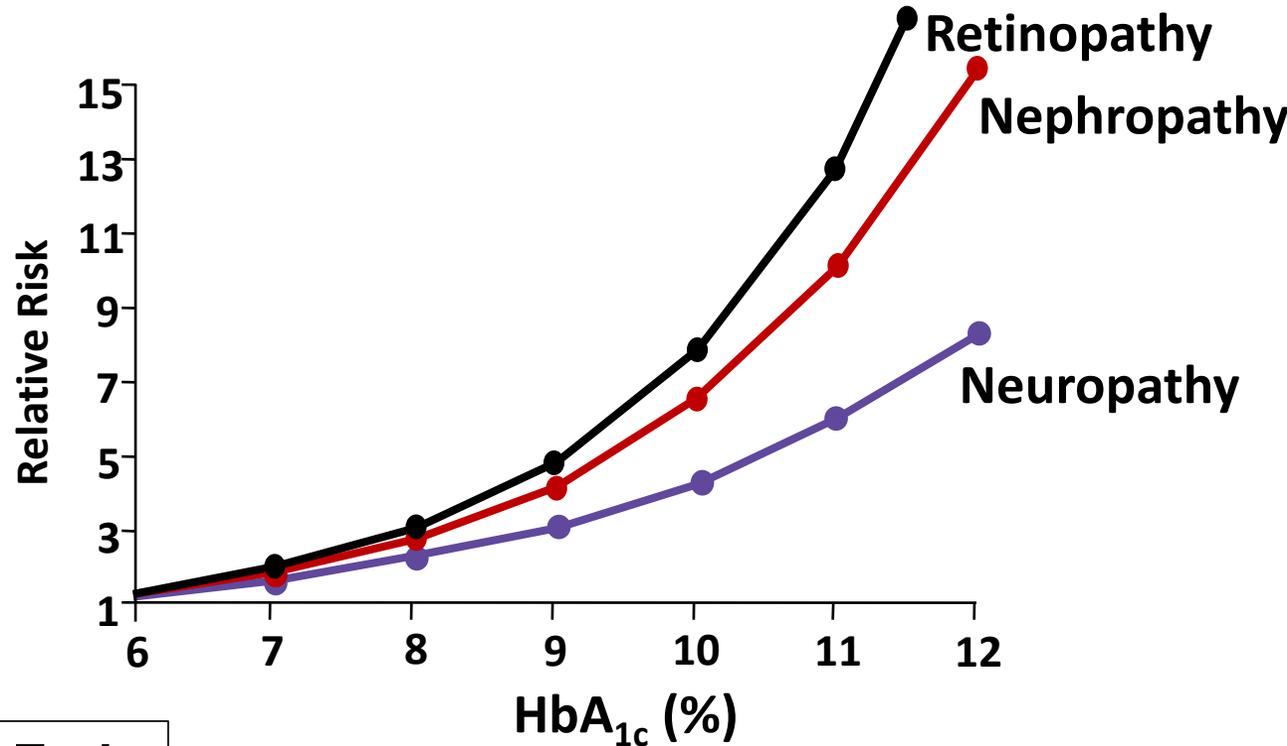

**Abstract Background.** Long-term microvascular and neurologic complications cause major morbidity and mortality in patients with insulin-dependent diabetes mellitus (IDDM). We examined whether intensive treatment with the goal of maintaining blood glucose concentrations close to the normal range could decrease the frequency and severity of these complications.

**Methods.** A total of 1441 patients with IDDM — 726 with no retinopathy at base line (the primary-prevention cohort) and 715 with mild retinopathy (the secondary-intervention cohort) were randomly assigned to intensive therapy administered either with an external insulin pump or by three or more daily insulin injections and guided by frequent blood glucose monitoring or to conventional therapy with one or two daily insulin injections. The patients were followed for a mean of 6.5 years, and the appearance and progression of retinopathy and other complications were assessed regularly.

**Results.** In the primary-prevention cohort, intensive therapy reduced the adjusted mean risk for the development of retinopathy by 76 percent (95 percent confidence

interval, 62 to 85 percent), as compared with conventional therapy. In the secondary-intervention cohort, intensive therapy slowed the progression of retinopathy by 54 percent (95 percent confidence interval, 39 to 68 percent) and reduced the development of proliferative or severe nonproliferative retinopathy by 47 percent (95 percent confidence interval, 14 to 67 percent). In the two cohorts combined, intensive therapy reduced the occurrence of microalbuminuria (urinary albumin excretion of  $\geq 40$  mg per 24 hours) by 39 percent (95 percent confidence interval, 21 to 52 percent), that of albuminuria (urinary albumin excretion of  $\geq 300$  mg per 24 hours) by 54 percent (95 percent confidence interval, 19 to 74 percent), and that of clinical neuropathy by 60 percent (95 percent confidence interval, 38 to 74 percent). The chief adverse event associated with intensive therapy was a two-to-threefold increase in severe hypoglycemia.

*Conclusions.* Intensive therapy effectively delays the onset and slows the progression of diabetic retinopathy, nephropathy, and neuropathy in patients with IDDM. (N Engl J Med 1993;329:977-86.)

End DCCT 1993

“HbA1c Era”

2025

# Limitations of HbA<sub>1c</sub>

1. HbA<sub>1c</sub> can be impacted by:

- Hemoglobinopathies
- Iron deficiency
- CKD
- Liver disease
- Individual changes in RBC lifespan
- Unknown genetic factors affecting glycation
- Race
- Age

2. HbA<sub>1c</sub> does not identify hypoglycemia or glucose variability

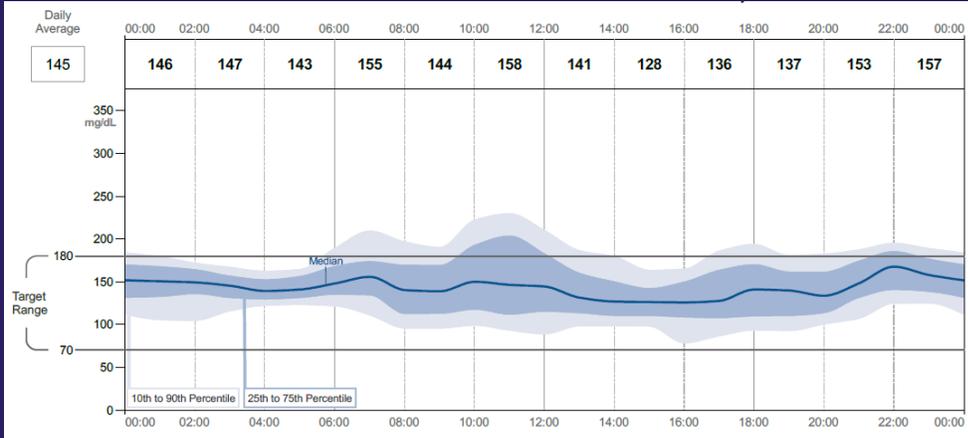

# A1C or CGM for management?

**A1C**  
(%)

## Glycemic Control

**Can continuous glucose monitoring (CGM) help?**

# What is continuous glucose monitoring (CGM)?

- Gathers data continuously (alerts, alarms, trend arrows)
- Includes a sensor, transmitter, and receiver device (or phone with corresponding app)
- Data can be transmitted from smartphone to cloud-based repositories for retrospective review
- Lag time of 5-6 minutes between intravascular and interstitial compartments

G7 (10 day)  
G7 15 Day

Eversense 365-Implantable CGM

Medtronic Guardian 4, Simplerla Sync, and Instinct

# Over the Counter CGM/Biosensor Systems

## Abbott Lingo:

- 14 day biosensor with minute by minute continuous glucose tracking
- No stand-alone reader/receiver, requires the Lingo app (currently only compatible with iPhone 11 or later)

## Dexcom Stelo:

- 15 day biosensor with continuous glucose tracking. Readings are taken every 15 minutes
- No stand-alone reader/receiver, requires the Stelo app, available for both iPhone or Android
- No low glucose alerts

# Benefits of CGM use in Diabetes Care

- Improved glycemic management (lower A1C, less hypoglycemia)
- Continuous monitoring – real time data, alerts, alarms, trend arrows
- Empower people with knowledge to make changes
  - Share data with clinic or follower (e.g. parent, spouse, school RN, etc.)
- Convenience
- Support more meaningful conversations and shared decision making
- Valuable tool for virtual diabetes care
- Some CGM systems are compatible with other diabetes technologies (e.g. insulin pumps, AID)

Image from FreeStyle Libre 3 User's Manual.

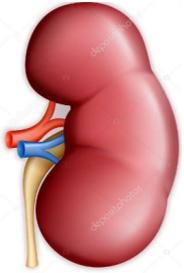

# Limitations/Barriers with CGM use in Diabetes Care

- Lag time
- Accuracy (improving with newer models)
- Subcutaneous insertion
- Cost
- Access (racial disparities, geographic location, internet access, provider implicit bias, etc)
- Sensor adhesion
- Skin irritation/adhesive reactions

**More Green**  
**Less Red**

Each 5%  in TIR (70-180 mg/dL) is clinically significant

## Time in Ranges Goals for Type 1 and Type 2 Diabetes

Test Patient DOB: Jan 1, 1970

14 Days: August 8-August 21, 2021

Time CGM Active: 100%

### Glucose Metrics

Average Glucose ..... **175 mg/dL**

Goal: <154 mg/dL

Glucose Management Indicator (GMI) ..... **7.5%**

Goal: <7%

Glucose Variability ..... **45.5%**

Defined as percent coefficient of variation

Goal: <36%

# Glucose Management Indicator (GMI)

- Replaces estimated A1C (eA1C)
- Avoids confusion when eA1C and laboratory A1C did not match
- GMI and lab A1C discordance common due to differences in red blood cell lifespan, timing of lab vs. CGM data, sudden change in therapy (e.g., starting insulin, steroids) etc.
  - About 50% of time absolute difference between GMI and lab A1C will be  $\geq 0.3\%$

# Difference Between GMI and Lab HbA1c

- Only **19%** of the estimated and measured HbA1c values ***matched*** (<0.1%)
- 51% differed by 0.3% or more
- 28% differed by 0.5% or more
- 19% differed by 0.6% or more
- *12% differed by 0.7% or more*

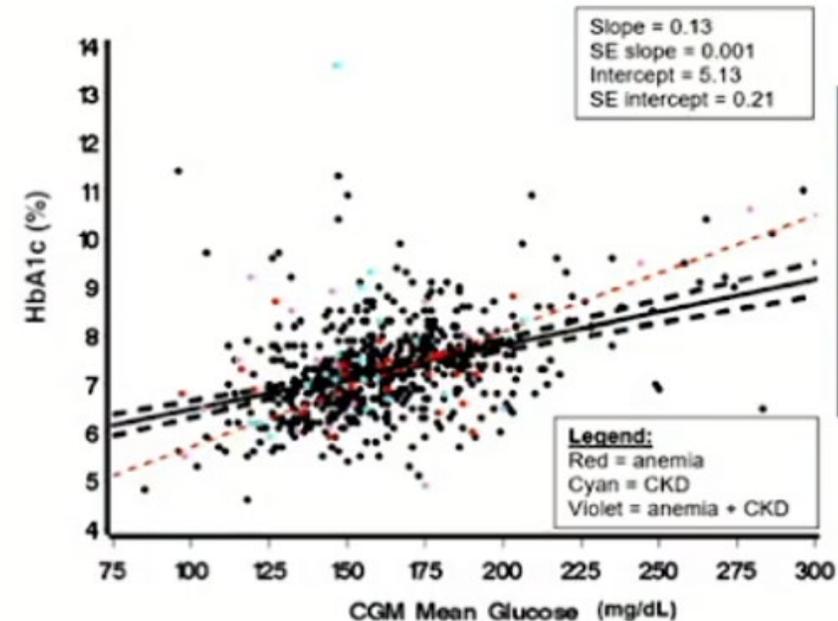

## CGM Discordance:

11% < 0.1%

50% ≥ 0.5%

22% ≥ 1.0%

Increased discordance with eGFR < 60

**A1C GMI Discordance:** Real-World  
DTT Apr, 2021. Hirsch IB, U. Wash. Endo Clinic

***GMI --- HbA1c Mismatches: May be clinically important.***

***GMI --- represents each person's actual glucose levels and tissue exposure***

# Glucose Variability

Coefficient of Variation = (standard deviation/mean glucose)

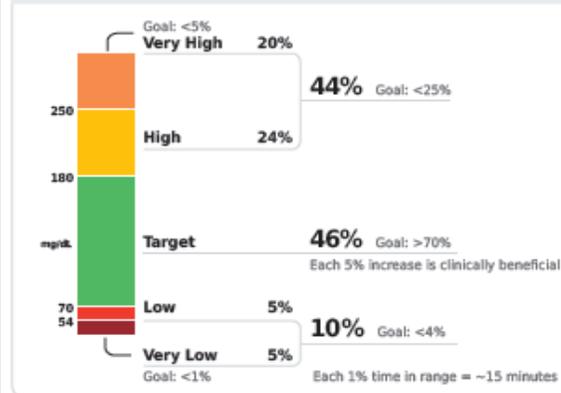

CV Target  $\leq 36\%$

Monnier L, Colette C, Wojtusciszyn A, et al. Toward defining the threshold between low and high glucose variability in diabetes. *Diabetes Care* 2017;40:832–838

## AGP Report: Continuous Glucose Monitoring

Time in Ranges Goals for Type 1 and Type 2 Diabetes

Sam Test Patient DOB: Jan 1, 1970

14 Days: August 8–August 21, 2021

Time CGM Active: 100%

### Glucose Metrics

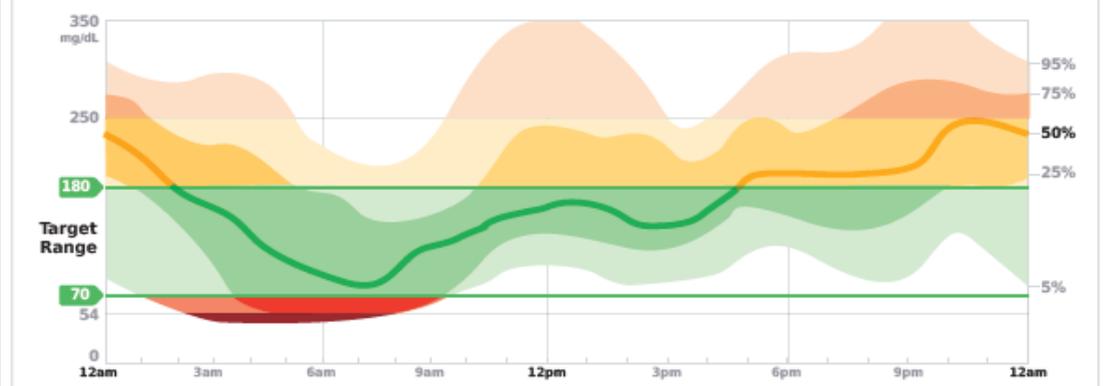

Average Glucose ..... **175 mg/dL**  
Goal: <154 mg/dL

Glucose Management Indicator (GMI) ..... **7.5%**  
Goal: <7%

**Glucose Variability ..... 45.5%**  
Defined as percent coefficient of variation  
Goal:  $\leq 36\%$

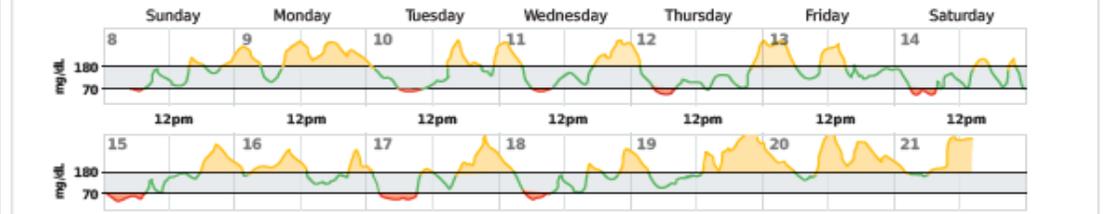

### Ambulatory Glucose Profile (AGP)

AGP is a summary of glucose values from the report period, with median (50%) and other percentiles shown as if they occurred in a single day.

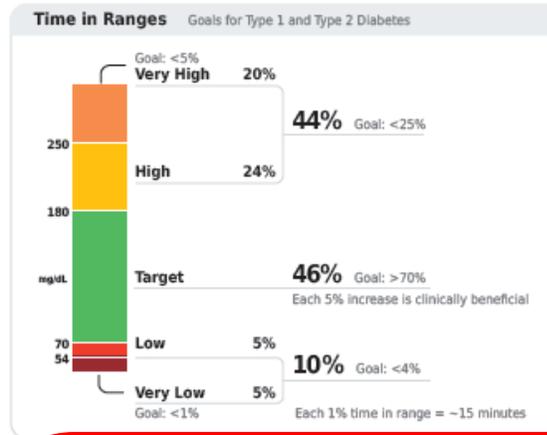

### Daily Glucose Profiles

Each daily profile represents a midnight-to-midnight period.

# AGP Report

**Test Patient** DOB: Jan 1, 1970  
**14 Days: August 8-August 21, 2021**  
**Time CGM Active: 100%**

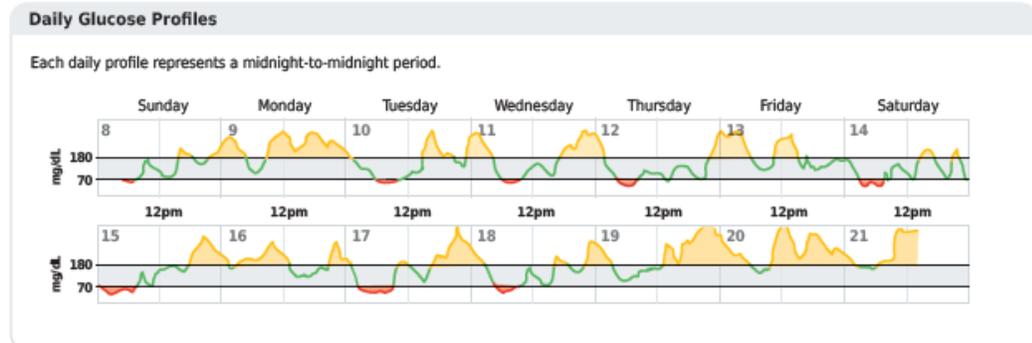

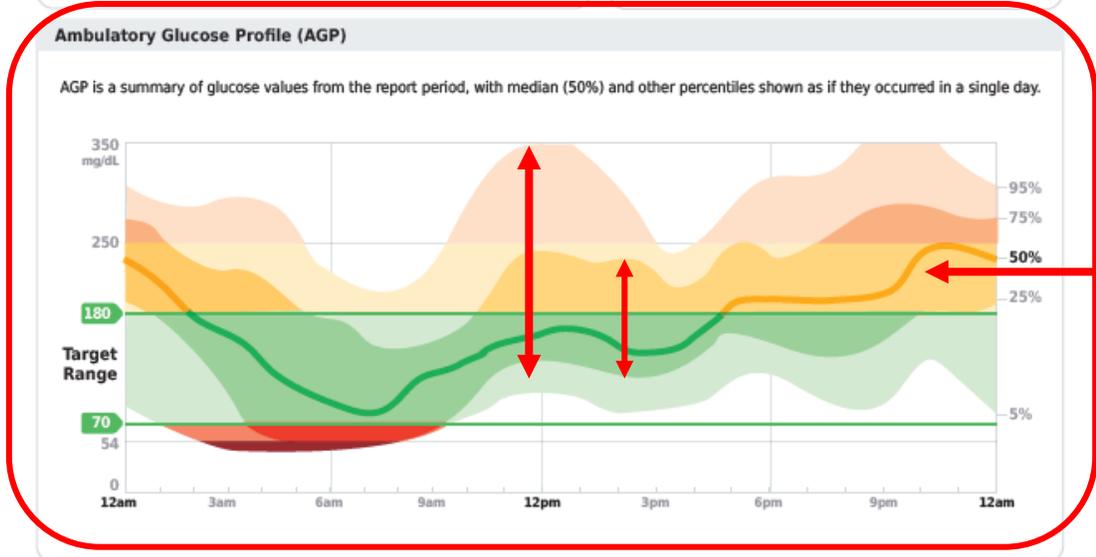

**Glucose Metrics**

**Average Glucose**..... **175 mg/dL**  
 Goal: <154 mg/dL

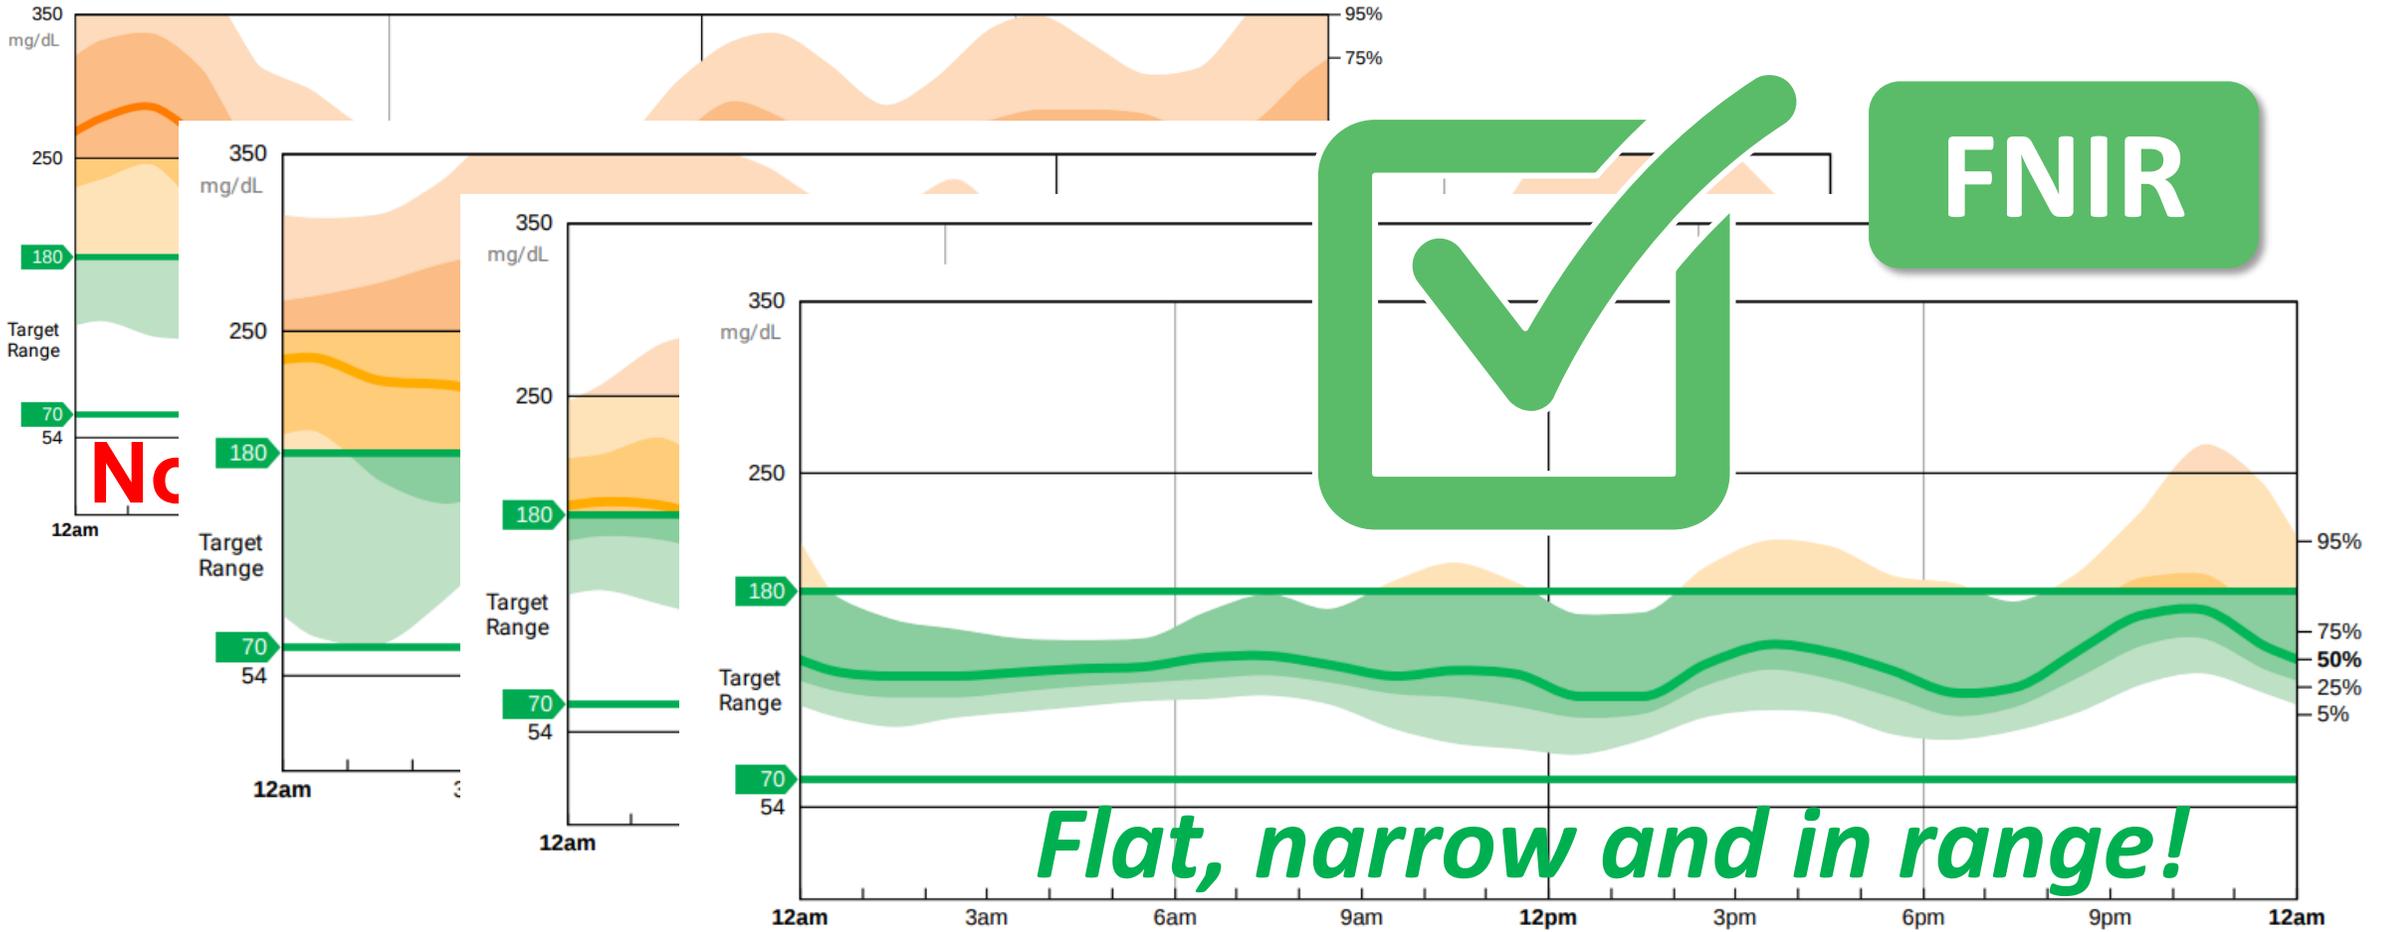

**Glucose Management Indicator (GMI)**..... **7.5%**  
 Goal: <7%

**Glucose Variability**..... **45.5%**  
 Defined as percent coefficient of variation  
 Goal: ≤36%

AGP Curve (14 days) →

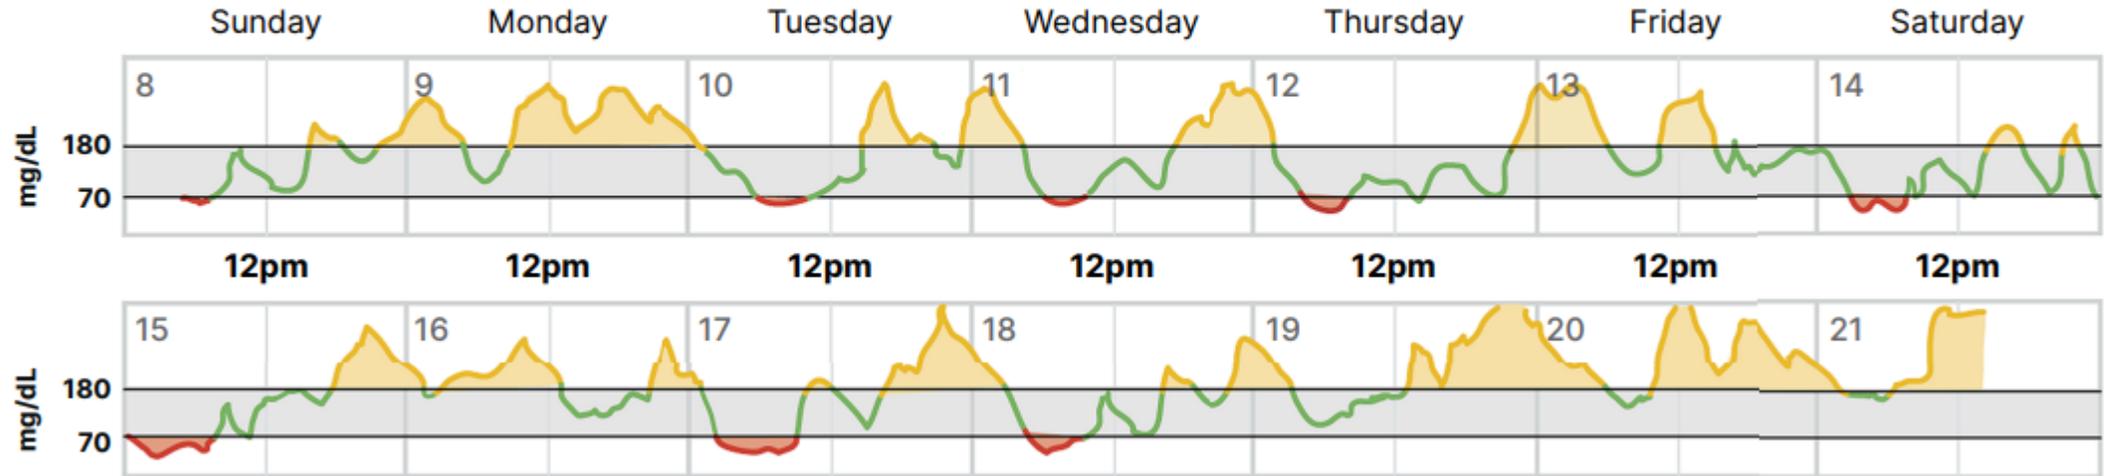

# What are we striving for in the AGP?

## Daily Glucose Profiles

Each daily profile represents a midnight-to-midnight period.

- Tracks glucose throughout day and night
- Identify patterns vs. isolated events (e.g. compression low)
- Weekday vs weekend patterns
- Impact of lifestyle modifications on glucose

# Presentation Outline

- Moving Beyond A1C

- Benefits of CGM and when to recommend
- Introduction to the AGP Report
- **Plan Coverage for Baylor Scott & White**

# CGM Coverage by Health Plan Type and Population

Population	Baylor Scott & White (BSW)	Medicare
Type 1 diabetes	Yes w/PA	Yes w/PA
Type 2 diabetes with any insulin therapy	Yes w/PA	Yes w/PA
Type 2 diabetes treated with noninsulin therapies	Yes if documented hypoglycemia	Yes w/PA
Gestational Diabetes Mellitus (GDM)	No	Yes w/PA
Prediabetes	No	No

**Medicare Coverage criteria:**

- Diagnosis of Type 1 Diabetes, Type 2 Diabetes, Gestational Diabetes
  - Insulin treated **OR** Documented history of problematic hypoglycemia such as recurrent level 2 hypo (>54 mg/dl) or at least one level 3 event (patient requires help from a third-party)
  - Training – your provider must confirm you or a caregiver are trained to use CGM
  - Provider visit (in-person or telehealth) within the last 6 months.
- Prior authorizations are commonly needed

# Baylor Scott & White Plan CGM Coverage

# 1/1/2026 Preferred Continuous Glucose Monitor (CGM) List

Formulary	Preferred	Non-Formulary
<b>Medicare (Seniorcare)</b>	Dexcom, Freestyle	Eversense, Medtronic, Signos
<b>Group Value (LG/ASO)</b>	Dexcom, Freestyle	Eversense, Medtronic, Signos
<b>Health Insurance Marketplace Formulary - HIM (SG/Individual)</b>	Dexcom	Eversense, Freestyle, Medtronic, Signos

# CGM Utilization Management: 1/1/2026

## CGMs

### Medicare (Seniorcare)

PA and QL requiring a diagnosis of diabetes, sufficient training to use it, prescribed in accordance of an FDA indication for use, use of insulin or problematic hypoglycemia defined as:

Medical record documentation of 2 or more episodes of a level 2 hypoglycemic event (glucose <54mg/dl) or

Medical record documentation of 1 episode of a level 3 hypoglycemia (glucose <54mg/dL with altered mental and/or physical state that requires third party assistance for treatment),

must have a provider visit within the last 6 months before ordering CGM

### Group Value (LG/ASO)

PA and QL with a prerequisite use of insulin or if not on insulin,

Medical record documentation of 2 or more episodes of a level 2 hypoglycemic event (glucose <54mg/dl) or

Medical record documentation of 1 episode of a level 3 hypoglycemia (glucose <54mg/dL with altered mental and/or physical state that requires third party assistance for treatment)

### Health Insurance Marketplace Formulary - HIM (SG/Individual)

PA and QL with a prerequisite use of insulin
